

Question:

Lana is brewing cups of tea for her friends. She has 27 cups, and she divides these into 3 rows. In each row, she creates equal amounts of chamomile and mint tea cups. She then uses the remaining cups to brew a total of 15 cups of cinnamon tea. How many cups of mint tea are in each row?

Reasoning + Answer:

<think>She has 27 cups and uses 15 for cinnamon so $27 - 15 = 12$. She puts that into 3 rows so $12 / 3 = 4$. So there are 4 in each row. </think><answer>4</answer>
