

Question:

Billy is buying some candy with \$10 his father gave him. The candy costs \$1.5 a pound. After buying candy, he takes half his change and spends it on gumballs, which cost \$.05 each. If he bought 40 gumballs, how many pounds of candy did he buy?

Reasoning + Answer:

<think> He started with 10, spent $10 * 0.5 = 5$ on gumballs. So $10 - 5 = 5$ left. Each pound is 1.5 so $5 / 1.5 = 3.3$ so he bought 3.3 pounds of candy. Since you can't buy a fraction of a pound he must have bought 3 pounds. </think> <answer> 3 </answer>
