

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think> Wendi is giving each of her 20 chickens 3 cups of feed. So, total feed given per chicken will be 3. Total number of chickens is 20. So, total feed given to all chickens per day will be $3 * 20 = 60$ cups. She has already given them 15 cups in the morning. And she has given them another 25 cups in the afternoon. Total feed given so far is $15 + 25 = 40$ cups. Now, she needs to find out the feed required for the final meal. So, feed required for the final meal will be $60 - 40 = 20$ cups. Therefore, Wendi needs 20 cups of feed for the final meal of the day </think>
<answer>20</answer>
