

Question:

Tom's ship can travel at 10 miles per hour. He is sailing from 1 to 4 PM. He then travels back at a rate of 6 mph. How long does it take him to get back?

Reasoning + Answer:

<think> Tom's ship is traveling from 1 to 4 PM. So, he is sailing for 3 hours at a speed of 10 miles per hour. Distance = Speed * Time. Distance = 10 * 3. Distance = 30 miles. Now, he is traveling back. His speed is 6 miles per hour. To find time, we divide distance by speed. Time = Distance / Speed. Time = 30 / 6. Time = 5 hours. So, it will take him 5 hours to get back.
</think><answer>5</answer>
