

Question:

Molly is catering a birthday party for her sister and invited 16 people. 10 people want the chicken salad which is \$6.50 per person and 6 people want the pasta salad at \$6 per person. What is the total amount Molly will pay for the catering?

Reasoning + Answer:

<think> First, first, I will find out the total cost of chicken salad, Cost of chicken salad = $10 \text{ people} * 6.50 \text{ per person} = 65$ Next, I will find out the total cost of pasta salad, Cost of pasta salad = $6 \text{ people} * 6 \text{ per person} = 36$ Now, I will find the total amount Molly will pay, Total cost = $65 + 36 = 101$ </think> <answer> 101 </answer>
