

Question:

Eliza's rate per hour for the first 40 hours she works each week is \$10. She also receives an overtime pay of 1.2 times her regular hourly rate. If Eliza worked for 45 hours this week, how much are her earnings for this week?

Reasoning + Answer:

<think> To calculate Eliza's total earnings for the week, we need to first calculate her earnings for the first 40 hours of work. Since her rate is \$10 per hour, her earnings for the first 40 hours would be $40 * 10 = 400$. Next, we need to calculate her earnings for the remaining 5 hours of overtime work. Her overtime rate is 1.2 times her regular rate, so it would be $10 * 1.2 = 12$ dollars per hour. Therefore, her earnings for the overtime hours would be $5 * 12 = 60$. To find her total earnings for the week, we add her earnings for the first 40 hours and the overtime hours: $400 + 60 = 460$. </think><answer> 460 </answer>
