

Question:

Eliza's rate per hour for the first 40 hours she works each week is \$10. She also receives an overtime pay of 1.2 times her regular hourly rate. If Eliza worked for 45 hours this week, how much are her earnings for this week?

Reasoning + Answer:

<think> To calculate Eliza's total earnings for the week, we need to first calculate her earnings for the regular 40 hours of work. Her regular hourly rate is \$10, so for 40 hours, she would earn $40 * 10 = \$400$. Since she worked 45 hours in total, she has $45 - 40 = 5$ hours of overtime. Her overtime pay is 1.2 times her regular hourly rate, so she earns $5 * 10 * 1.2 = \$60$ for overtime. To find her total earnings for the week, we add her regular earnings and overtime earnings: $\$400 + \$60 = \$460$. </think><answer> 460 </answer>
