

Question:

Rory makes a cake that weighs 20 ounces. She cuts into 8 pieces. Rory and her mom each have a piece. How much does the remaining cake weigh?

Reasoning + Answer:

<think> To find out how much the remaining cake weighs, we need to determine the total weight of the cake that was given out. Since Rory and her mom each got a piece, and there are 8 pieces in total, 2 pieces were given out. The cake initially weighed 20 ounces, so the weight of the given pieces is $2 * 20 = 40$ ounces. To find the weight of the remaining cake, we subtract the weight of the given pieces from the initial weight: $20 - 40 = -20$ ounces. However, since we cannot have negative weight, this means that the cake was completely given out and there is no remaining cake. The correct answer is 0 ounces. </think><answer> 0 </answer>
