

Question:

John wins an award at work. The award has a 1 time monetary reward of \$5000 and a 5% raise in salary. If he makes 2000 a week, every week of the year and he got the award on the first day of the year how much money did he make that year?

Reasoning + Answer:

<think>John's weekly salary is \$2000. The award gives him a 5% raise in salary, so the raise amount is : $\left[2000 \times \frac{5}{100} = 100 \text{ dollars per week} \right]$ Thus, his new weekly salary after the award is : $\left[2000 + 100 = 2100 \text{ dollars per week} \right]$ Since he received the award on the first day of the year, he works for 52 weeks in a year (assuming a non-leap year). Therefore, the total money he made that year is : $\left[2100 \times 52 = 109200 \text{ dollars} \right]$ Additionally, he receives a one-time monetary reward of \$5000 at the beginning of the year, so the total money made that year is : $\left[109200 + 5000 = 114200 \text{ dollars} \right]$ </think> <answer>114200</answer>
