

Question:

Mark buys a fleet of 12 cars for his company. Each car sells for \$20,000. He pays 10% tax on the cars and then another \$1000 for registration on each of them. How much does he pay for everything?

Reasoning + Answer:

<think>First let's calculate the total cost of the cars. Since each car sells for 20000 dollars and he buys 12 cars. $20000 * 12 = 240000$ dollars. Next let's calculate the tax he has to pay. Since he pays 10% tax on the cars. 10% of 240000 dollars is $0.1 * 240000 = 24000$ dollars. Now let's calculate the cost of registration. Since he has to pay 1000 dollars for registration on each car. And he buys 12 cars. $1000 * 12 = 12000$ dollars. Finally let's calculate the total cost. The total cost consists of the cost of the cars, the tax, and the registration cost. $240000 + 24000 + 12000 = 276000$ dollars. Therefore he pays a total of 276000 dollars for everything. </think><answer>276000</answer>
