

Question:

Lady with infeility with bilateral tubal block at cornua : best method of management is :Answer Choices:A. Laparoscopy and hysteroscopyB. HydrotubationC. IVFD. Tuboplasty

Reasoning + Answer:

<think>The best method of management for a lady with infertility and bilateral tubal block at the cornua is IV F (In Vitro Fertilization). This is because IV F is a direct approach to bypass the blocked tubes and allow fertilization to occur outside the body . It does not require the restoration of tubal patency or the use of the fallopian tubes for fertilization . Laparoscopy and hysteroscopy may be used to diagnose the blockage , but they are not a treatment for tubal blockage . Hydrotubation is a diagnostic procedure that involves flushing the tubes with fluid to check for patency , but it is not a treatment for blocked tubes . Tuboplasty is a surgical procedure that aims to repair or reconstruct the tubes , but its success rates are variable and may not be as effective as IV F for treating bilateral tubal blockage . </think><answer>C . IV F </answer>
