

Question:
Bivalent meningococcal vaccine is ?
Answer Choices:
A. A Y
B. A C
C. C y
D. A W-I35

Reasoning + Answer:

<think>
The bivalent meningococcal vaccine is a type of vaccine that protects against two different serogroups of Neisseria meningitidis, the bacteria that cause meningitis. The most common serogroups are A, C, W, Y, and B. The bivalent meningococcal vaccine typically targets serogroups A and C, which are the most common causes of meningitis in certain regions.

Considering the options provided :

A. A Y: This option suggests a bivalent vaccine targeting serogroups A and Y, but it is not the most common combination.

B. A C: This option suggests a bivalent vaccine targeting serogroups A and C, which is the most common combination used in many countries.

C. C y: This option is not a standard bivalent meningococcal vaccine combination.

D. A W-I35: This option is not a standard bivalent meningococcal vaccine combination, and the term "I35" is not a recognized serogroup.

Based on the information, the most likely bivalent meningococcal vaccine combination is targeting serogroups A and C.
