

Question:
Verocay bodies are seen in
Answer Choices:
A. Memingioma
B. Hemangioma
C. Glioma
D. Shwannoma

Reasoning + Answer:

<think>
To solve this question , we need to analyze the characteristics of Verocay bodies and associate them with the given options .

Verocay bodies are a type of cellular structure found in certain types of tumors . They are typically composed of perivascular pseudorosettes , which are aggregations of tumor cells surrounding blood vessels . Verocay bodies are a hallmark feature of Antoni A tissue in schwannomas , which are tumors that arise from the Schwann cells of the peripheral nerves .

A. Meningioma : Meningiomas are tumors that arise from the meninges , the protective membranes surrounding the brain and spinal cord . They are not typically associated with Verocay bodies .

B. Hemangioma : Hemangiomas are benign tumors composed of blood vessels . They do not typically exhibit Verocay bodies .

C. Glioma : Gliomas are tumors that arise from the glial cells of the brain and spinal cord . They are not typically associated with Verocay bodies .

D. Schwannoma : Schwannomas are tumors that arise from the Schwann cells of the peripheral nerves . They are characterized by the presence of Antoni A and Antoni B tissue , which includes Verocay bodies .

Considering the characteristics of Verocay bodies and their association with schwannomas , the correct answer is D. Schwannoma .
