

Question:
White infracts are seen in which of the following
Answer Choices:
A. Kidney
B. Spleen
C. Hea
D. All the above

Reasoning + Answer:

<think>
To determine the correct answer , let's consider the characteristics of white infarcts . White infarcts are typically seen in solid organs that have a single blood supply , such as the heart , sple en , and kidneys . These organs are more prone to ischemia and infarction due to their limited collateral circulation .

The heart , specifically the myocardium , can develop white infarcts due to an occlusion of a coronary artery , leading to a lack of blood flow and oxygenation . This is a common cause of white infarcts in the heart .

The sple en can also develop white infarcts , particularly in the context of sickle cell disease or other conditions that affect blood flow to the sple en . The sple en 's unique blood supply and its susceptibility to ischemia make it a site for white infarctions .

Kid neys can also experience white infarcts , often due to embolic events or thrombotic conditions that block the renal arteries . The kidneys ' single blood supply and the potential for embolic events make them prone to white infarctions .

Considering the characteristics of white infarcts and the organs listed , it is clear that all three organs (heart , sple en , and kidneys) can develop white infarcts due to their anatomy and blood supply .
