

Question:
White infracts are seen in which of the following
Answer Choices:
A. Kidney
B. Spleen
C. Hea
D. All the above

Reasoning + Answer:

<think>
To solve this question , we need to analyze the options provided and determine which organ is associated with white infracts .

White infracts are typically seen in organs that have a dual blood supply , such as the spleen . The spleen receives blood from both the arterial and venous systems , which can lead to the formation of white infracts when there is an obstruction in one of the blood vessels . This is in contrast to red infracts , which are typically seen in organs with a single blood supply , such as the heart .

The kidney (A) is also an organ that can experience infracts , but they are usually red infracts due to its single blood supply . The heart (C) can also experience infracts , but again , they are typically red infracts due to its single blood supply .

Considering the options provided , the spleen (B) is the most likely organ to experience white infracts due to its dual blood supply .

Therefore , based on the analysis , the correct answer is the option that includes the spleen as the organ associated with white infracts .
