

Question:
Bivalent meningococcal vaccine is ?
Answer Choices:
A. A Y
B. A C
C. C y
D. A W-I35

Reasoning + Answer:

<think>
The bivalent meningococcal vaccine is a type of vaccine that protects against two specific serogroups of Neisseria meningitidis, which are the most common causes of meningococcal disease. The "A" in the option refers to serogroup A, and the "C" refers to serogroup C. The vaccine is designed to provide immunity against these two serogroups, which are responsible for the majority of meningococcal disease cases.

The bivalent meningococcal vaccine typically contains components that protect against serogroups A and C, making it an effective tool in preventing meningococcal disease in individuals, particularly in areas where these serogroups are prevalent.

Given this information, we can conclude that the bivalent meningoccal vaccine is designed to protect against serogroups A and C, making option B the correct answer.
