

Question:
Verocay bodies are seen in
Answer Choices:
A. Meningioma
B. Hemangioma
C. Glioma
D. Shwannoma

Reasoning + Answer:

<think>
To answer this question , we need to identify the characteristic histopathological feature associated with Verocay bodies . Verocay bodies are a distinctive histopathological feature seen in schwannomas , which are benign tumors arising from the Schwann cells of the peripheral nerves . They are characterized by a palisading arrangement of Antoni A cells around a central area of degeneration .

A . Meningioma : Meningiomas are benign tumors arising from the meninges , the protective membranes surrounding the brain and spinal cord . They do not typically exhibit Verocay bodies .

B . Hemangioma : Hemangiomas are benign vascular tumors composed of blood vessels . They do not have a specific association with Verocay bodies .

C . Glioma : Gliomas are tumors arising from the glial cells of the brain and spinal cord . While they can exhibit various histopathological features , Verocay bodies are not characteristic of gliomas .

D . Shwannoma : Schwannomas , also known as neurilemmomas , are benign tumors arising from the Schwann cells of the peripheral nerves . They are known for their characteristic Verocay bodies , which are a key diagnostic feature .

Considering the association of Verocay bodies with schwannomas , the correct answer is related to this type of tumor .
