

Question:
Bivalent meningococcal vaccine is ?
Answer Choices:

- A. A Y
- B. A C
- C. C y
- D. A W-I35

Reasoning + Answer:

<think>
The bivalent meningococcal vaccine refers to a vaccine that protects against two specific serogroups of Neisseria meningitidis, which cause meningococcal disease. The most common bivalent vaccine available is the MenACWY vaccine, which protects against serogroups A, C, W, and Y. This vaccine is commonly used in the United States and other countries to prevent meningococcal disease.

The correct answer would be the one that matches the composition of the bivalent meningococcal vaccine, which includes protection against serogroups A and C, as well as W and Y.

Considering the options provided, option A (A, C, W, Y) is the correct composition of the bivalent meningococcal vaccine.
