

Question:
Verocay bodies are seen in
Answer Choices:
A. Meningioma
B. Hemangioma
C. Glioma
D. Schwannoma

Reasoning + Answer:

<think>
To answer this question, we need to identify the correct association of Verocay bodies with a specific type of tumor. Verocay bodies are characteristic histopathological features found in certain types of neoplasms.

Verocay bodies are specifically associated with meningiomas, which are tumors that arise from the meninges, the protective membranes surrounding the brain and spinal cord. They are a type of benign tumor that can occur in the central nervous system. The presence of Verocay bodies is a diagnostic feature of meningiomas, particularly in the context of psammomatous meningiomas.

The other options can be eliminated based on the following reasoning:

- B. Hemangioma: Hemangiomas are benign vascular tumors composed of blood vessels, but they are not typically associated with Verocay bodies.
- C. Glioma: Gliomas are tumors that arise from glial cells in the brain or spine, but they are not characterized by the presence of Verocay bodies.
- D. Schwannoma: Schwannomas are tumors that arise from Schwann cells, which are a type of glial cell that surrounds nerve fibers. While schwannomas can have various histological features, Verocay bodies are not a characteristic finding.

Considering the association of Verocay bodies with meningiomas, the correct answer is clear.
