

Question:
White infracts are seen in which of the following
Answer Choices:
A. Kidney
B. Spleen
C. Hea
D. All the above

Reasoning + Answer:

<think>
To determine the correct answer , we must consider the definition and common locations of white infarcts . Infarcts are areas of dead tissue resulting from a lack of blood supply , often due to a blockage or obstruction . White infarcts typically occur in solid organs and are characterized by a pale or white appearance due to the coagulative necrosis of the affected tissue .

Considering the options provided :

A . Kidney - White infarcts can occur in the kidneys , particularly in the renal cortex , due to reduced blood flow .

B . Spleen - White infarcts can also occur in the spleen , usually as a result of a splenic artery occlusion .

C . Heart - White infarcts are most commonly associated with the heart , particularly in the case of myocardial infarction (heart attack) , where the lack of blood supply leads to coagulative necrosis of the heart muscle .

D . All the above - Given that white infarcts can occur in all three organs , this option is the most comprehensive and accurate .
