

Question:

Shock causes:

Answer Choices:

- A. Stagnant hypoxia
- B. Anemic hypoxia
- C. Hypoxic hypoxia
- D. Histotoxic hypoxia

Reasoning + Answer:

<think>

To approach this question , we need to understand the different types of shock and their causes .

Shock is a life -threatening condition that occurs when the body 's tissues are not receiving enough oxygen . There are several types of shock , including hypovolemic shock , cardiogenic shock , obstructive shock , and distributive shock .

Hypoxic hypoxia refers to a condition where there is a lack of sufficient oxygen in the blood , which can be caused by various factors such as respiratory or cardiac dysfunction . Anemic hypoxia occurs when there is a deficiency in the number or function of red blood cells , leading to inadequate oxygen delivery to tissues . Stagnant hypoxia is caused by a decrease in blood flow , which can be due to cardiac dysfunction or other factors .

Histotoxic hypoxia refers to a condition where tissues are unable to utilize oxygen due to the presence of toxins or poisons that interfere with cellular respiration .

Considering the definition of shock as a condition where tissues are not receiving enough oxygen , we can infer that shock is most closely related to hypoxic hypoxia .
