

Question:
White infracts are seen in which of the following
Answer Choices:
A. Kidney
B. Spleen
C. Hea
D. All the above

Reasoning + Answer:

<think>
To determine which organ is associated with white infarcts , let's consider the characteristics and blood supply of each organ .

White infarcts typically occur in organs that have a dual blood supply , allowing for some areas to remain viable even after an occlusion .

The spleen has a dual blood supply from the splenic artery and the short gastric arteries . This dual blood supply can lead to the formation of white infarcts , especially after splenic artery occlusion .

The kidneys and heart are primarily supplied by a single major artery and do not typically form white infarcts .

Considering the characteristics of the organs listed , the spleen is the most likely to form white infarcts due to its dual blood supply .
