

**Question:**  
White infracts are seen in which of the following  
Answer Choices:  
A. Kidney  
B. Spleen  
C. Hea  
D. All the above

**Reasoning + Answer:**

mobx  
White infracts are a term used in pathology to describe white , often fibrinous , deposits or infarcts . In medical terminology , "white infarcts" typically refer to areas of necrosis in solid organs due to ischemia . These are most commonly seen in organs with a well - organized , non - vascularized structure where necrosis occurs due to impaired blood supply .

- In the context of organ pathology :
- The kidney can show white infarcts , particularly in the case of renal infarction , which presents as a white , necrotic area .
  - The spleen can develop white infarcts , especially in conditions like splenic congestion or infarction due to embolic disease .
  - The heart can also show white infarcts , particularly in myocardial infarction , where the necrotic tissue appears white or pale .

Therefore , white infarcts can be observed in multiple organs , including the kidney , spleen , and heart . This is because all of these organs can experience ischemic injury due to vascular obstruction , leading to coagulative necrosis that appears white .

The term "white infarct" is not limited to one organ ; it is a general pathological finding in various organs when ischemia leads to coagulative necrosis .

Given that white infarcts are seen in kidney , spleen , and heart , and all are listed as possible sites , the correct answer must include all of them .

< answer >  
D . All the above
