

Question:
Coical representation of body in the cerebrum is
Answer Choices:
A. Horizontal
B. Veical
C. Tandem
D. Oblique

Reasoning + Answer:

<tool_call>

The representation of the body in the cere brum , specifically in the primary som atos ens ory cortex (S 1) and primary motor cortex (M 1), is known as the som at ot opic map or " hom unc ulus ." This map is located in the post central gyr us (for sensory) and pre central gyr us (for motor) of the cerebral cortex .

The key feature of this representation is that it is **not** uniform across the body . Instead , it is **in verted** in vertical orientation â Ğ Ğ the head and face are at the top , and the limbs are at the bottom . However , the question is asking for the *type* of representation , not the orientation .

- Now , let's consider the options :
- A . Horizontal â Ğ Ğ this would imply a side -to -side arrangement , which is not accurate .
 - B . Vertical â Ğ Ğ this refers to the vertical orientation of the som at ot opic map , where the body is arranged vertically , with head at top and feet at bottom . This is correct in terms of spatial orientation .
 - C . Tandem â Ğ Ğ this is not a standard term used in neuro an atomy for body representation .
 - D . Ob lique â Ğ Ğ this implies a diagonal arrangement , which is not the case .

Although the map is inverted , the body parts are arranged in a vertical layout in the cortex . The term "vertical" accurately describes the orientation of the som at ot opic representation .

Thus , the correct answer is B . Vertical , as the body is represented in a vertical plane in the cerebral cortex .

< answer >
B . Vertical
