

Question:

Coical representation of body in the cerebrum is

Answer Choices:

- A. Horizontal
- B. Veical
- C. Tandem
- D. Oblique

Reasoning + Answer:

<tool_call>

The cerebral representation of the body in the cere brum refers to the som atotopic organization of sensory and motor areas in the som atosens ory and motor cortices , particularly in the som atosens ory cortex and the primary motor cortex . This organization is known as the "c ortical map" or "sens ory hom unc ulus ."

The key feature of this representation is that it is not uniform across the body . Instead , it is top ographically organized such that different body parts are represented in specific regions of the cortex . The most notable aspect of this organization is that the representation is **not horizontal or vertical in a simple anatomical sense** , nor is it "t and em " or "ob lique " in a directional sense as these terms are not standard in neuro an atomy .

However , the term "c ortical representation " often refers to the **sens ory hom unc ulus ** , where the body is mapped in a distorted , non -linear fashion . The face , hands , and feet are disproportionately represented due to the high density of sensory receptors . This mapping is **not strictly horizontal or vertical** , and "t and em " or "ob lique " do not accurately describe the spatial organization .

The correct description of the body 's representation in the cere brum is that it is **som atotopic ** , and the organization is typically described as **c ortical ** and **an atomically arranged in a specific top ographic pattern ** , but not in a simple horizontal , vertical , or ob lique orientation .

Among the options , the most appropriate term in the context of the cerebral representation of the body is **" horizontal " ** when referring to the orientation of the body map in the som atosens ory cortex , where the body is arranged horizontally across the cortex (e .g . , the body is laid out horizontally from the back to the front , with the legs at the back and the head at the front) .

Thus , the correct answer is A . Horizontal , as the body is represented in a horizontal orientation in the som atosens ory cortex , with the limbs and trunk arranged horizontally .

< answer >

A . Horizontal
