

Question:
Bivalent meningococcal vaccine is ?
Answer Choices:

- A. A Y
- B. A C
- C. C y
- D. A W-I35

Reasoning + Answer:

The bivalent meningococcal vaccine typically covers two serogroups of Neisseria meningitidis , usually serogroups A and C . This type of vaccine is designed to protect against meningococcal disease caused by these two serogroups .

Let's analyze the given options :

- A . A Y : This option does not make sense in the context of vaccine nomenclature , as it includes a 'Y' which is not a standard component of meningococcal vaccine designations .
- B . A C : This option includes both serogroups A and C , which aligns with the definition of a bivalent meningococcal vaccine .
- C . C y : This option is not standard and includes a 'y' which is not typically used in vaccine naming for Neisseria meningitidis .
- D . A W-I35 : This option includes serogroups W and I - 35 , which are not the primary serogroups covered by a bivalent vaccine .

Given the context and the options provided , the correct choice for a bivalent meningococcal vaccine is one that covers serogroups A and C .

<think>
The bivalent meningococcal vaccine covers serogroups A and C . The option B . A C includes both of these serogroups .
</think>
<answer>
B . A C
</answer>
