

Question:
White infracts are seen in which of the following
Answer Choices:
A. Kidney
B. Spleen
C. Hea
D. All the above

Reasoning + Answer:

<think>
- White infarcts are typically associated with areas of the body where there is a high blood flow and resistance to arterial occlusion, leading to less collateral circulation.
- The spleen, kidney, and heart all have high blood flow and are susceptible to white infarcts when there is an arterial occlusion.
- The heart, in particular, is known for its white infarcts, especially in myocardial infarctions (heart attacks), due to the high blood flow and the lack of collateral circulation.
- The kidneys and spleen also commonly show white infarcts due to similar reasons but are less frequently cited in clinical scenarios compared to the heart.
- Therefore, the most accurate and comprehensive answer would include all three organs, as they all can develop white infarcts under similar circumstances.
