

Question:

Which type of articulators permit horizontal as well as vertical motion, but do not orient the motion to the TMJ via facebow transfer?

Answer Choices:

- A. Class I
- B. Class II
- C. Class III
- D. Class IV

Reasoning + Answer:

<think>

- Class I articulators are simple and only permit vertical motion , which does not fit the description .
- Class II articulators permit both vertical and horizontal motion but do not include a face bow transfer for orienting the motion to the TMJ , matching the description .
- Class III articulators permit both vertical and horizontal motion and also include a face bow transfer , which is not what we are looking for .
- Class IV articulators are typically used for complex cases and do not fit the description of not using a face bow transfer .

Therefore , the correct articulator type that matches the given description is Class II .

</think>

<answer>

B . Class II

</answer>
