

Question:

Which type of articulators permit horizontal as well as vertical motion, but do not orient the motion to the TMJ via facebow transfer?

Answer Choices:

- A. Class I
- B. Class II
- C. Class III
- D. Class IV

Reasoning + Answer:

<think>

- Class I articulators are simple and do not include face bow transfer , allowing only vertical motion .
- Class II articulators include a face bow transfer , which orients the motion to the TMJ , but only permit horizontal and vertical motions .
- Class III articulators also include a face bow transfer and allow for both horizontal and vertical motions , orienting the motion to the TMJ .
- Class IV articulators are similar to Class III articulators but do not include a face bow transfer , thus they do not orient the motion to the TMJ .

Given that the question specifies an articulator that permits horizontal as well as vertical motion but does not orient the motion to the TMJ via face bow transfer , it matches the description of a Class IV articulator .

</think>

<answer>

D . Class IV

</answer>
