

Question:
Lymphatic drainage of ovary?
Answer Choices:
A. Deep inguinal
B. Superficial inguinal
C. Obturator
D. Paraaortic

Reasoning + Answer:

<think>
- The ovary is a female reproductive organ located in the lower abdomen .
- The lymphatic drainage of the ovary primarily involves the lymph nodes that are anatomically closest to it .
- The ovary is situated in the pelvic cavity , and its lymphatic drainage typically follows the pelvic lymph nodes .
- The lymph nodes in the pelvis include the obturator lymph nodes , which are located in the upper thigh region and drain the pelvic organs , including the ovary .
- The deep inguinal lymph nodes and superficial inguinal lymph nodes are located in the groin area and drain the lower leg and perineum , respectively .
- The paraaortic lymph nodes are located along the aorta and drain the abdominal and pelvic structures but not the ovary specifically .

Given this anatomical information , the lymphatic drainage of the ovary is best represented by the obturator lymph nodes .
