

Question:
Bivalent meningococcal vaccine is ?
Answer Choices:
A. A Y
B. A C
C. C y
D. A W-I35

Reasoning + Answer:

<think>
To determine the correct answer , we need to understand the components of bivalent meningococcal vaccines .

1. **Bivalent Meningococcal Vaccine**: This type of vaccine is designed to protect against two serogroups of Neisseria meningitidis , which are the most common causes of bacterial meningitis .

2. **Serogroups Involved** :
- The most common serogroups targeted by bivalent meningococcal vaccines are serogroups A and C .
- Serogroup Y and W - 135 are also important but are typically targeted by trivalent or quadrivalent vaccines , not bivalent ones .

Given the options provided :
- A Y : This would imply a vaccine targeting serogroups A and Y .
- A C : This would imply a vaccine targeting serogroups A and C .
- C y : This would imply a vaccine targeting serogroups C and Y .
- A W - I35 : This would imply a vaccine targeting serogroups A and W - 135 .

Since the question specifically asks about a bivalent vaccine , it must target two serogroups . The most common bivalent vaccine targets serogroups A and C .
