

Question:
White infracts are seen in which of the following
Answer Choices:
A. Kidney
B. Spleen
C. Hea
D. All the above

Reasoning + Answer:

<think>
To determine which organs can show white infarcts , we need to understand the conditions under which white infarcts occur . White infarcts are typically seen in organs that have a dual blood supply , where one artery is blocked , leading to a lack of oxygen and nutrients in the affected area . This is a characteristic of the heart , kidney , and spleen .

- 1 . **Heart**: The heart has a dual blood supply from the left and right coronary arteries . If one of these arteries is blocked , it can lead to a myocardial infarction (heart attack) with a white appearance due to the lack of blood flow .
- 2 . **Kidney**: The kidneys have a dual blood supply from the renal arteries . If one of these arteries is blocked , it can lead to a renal infarct , which appears white due to the lack of oxygen and nutrients .
- 3 . **Spleen**: The spleen also has a dual blood supply from the splenic artery and the short gastric arteries . If one of these arteries is blocked , it can lead to a splenic infarct , which appears white .

Given that all three organs (heart , kidney , and spleen) can have dual blood supplies and can suffer from infarctions leading to white appearances , the correct answer would be that all of them can show white infarcts .
