

Question:
White infracts are seen in which of the following
Answer Choices:
A. Kidney
B. Spleen
C. Hea
D. All the above

Reasoning + Answer:

<think>
To determine where white infarcts are seen, we need to understand the conditions under which they occur. White infarcts are typically seen in organs with a dual blood supply, such as the kidney and the spleen. This dual supply allows for some collateral circulation, which can delay the onset of infarction.

- The kidney has a dual blood supply from the renal arteries, making it susceptible to white infarcts.
- The spleen also has a dual blood supply from the splenic artery and the short gastric arteries, making it susceptible to white infarcts as well.
- The heart, on the other hand, has a single coronary circulation, which means it is less likely to develop white infarcts because the lack of collateral circulation would lead to a more rapid onset of infarction, resulting in a red (anemic) infarct rather than a white one.

Given this information, the correct answer would be the organs that have a dual blood supply, which are the kidney and the spleen.
