

Question:

On a busy Saturday morning, a hotel was completely booked with 100 guests. 24 guests elected an early checkout and 15 elected for a late checkout. In the afternoon twice as many people checked in as those who opted for a late checkout. 7 more people checked in after dinner was served. How many guests does the hotel now have?

Reasoning + Answer:

<think>The hotel started with 100 guests. 24 guests checked out early. 15 guests checked out late. So $24 + 15 = 39$ guests left the hotel. The hotel now has $100 - 39 = 61$ guests. In the afternoon twice as many people checked in as the 15 that checked out late. So $2 * 15 = 30$ people checked in. After dinner, 7 more checked in. The total is $30 + 7 = 37$ more that checked in. So the new total of guests is $61 + 37 = 98$. The hotel now has 98 guests. </think>
<answer>The hotel now has 98 guests. </answer>
