

Question:

Shiela bought five cell phones for \$150 each for a 3-month installment. A 2% interest will be charged for each unit. How much will Shiela pay each month for 3 months?

Reasoning + Answer:

<think> Shiela is buying 5 cell phones. So, total cost of cell phones will be $5 * 150 = 750$.
Now, she has to pay installment for 3 months. So, monthly installment will be $750 / 3 = 250$.
Now, a 2% interest will be charged for each unit. So, interest per unit will be $2\% \text{ of } 150 = (2 / 100) * 150 = 3$. Total interest for 5 units will be $3 * 5 = 15$. So, total amount Shiela has to pay each month will be installment amount + interest amount. Total amount = $250 + 15 = 265$.
Therefore, Shiela will have to pay 265 each month for 3 months.</think><answer>265</answer>
