

Question:

Carly had 80 cards, $\frac{2}{5}$ of the cards had the letter A on them, $\frac{1}{2}$ of the remaining had the letter B, $\frac{5}{8}$ of the rest had the letter C on them, and the others had the letter D. How many of the cards had the letter D on them?

Reasoning + Answer:

<think>She had 80 cards $\frac{2}{5}$ of 80 is $\frac{2}{5} * 80 = 32$ So $80 - 32 = 48$ Half of the rest is $\frac{1}{2} * 48 = 24$ So far $32 + 24 = 56$ $\frac{5}{8}$ of the rest is $\frac{5}{8} * 24 = 15$ The others are $24 - 15 = 9$ <answer>9</answer>
