

Question:

There are 10000 gallons of water in a pool. Using a water pump, Anthony and his father fill a tank with half the amount of water in the pool. They use water from the tank to water their vegetable garden. If the tank is emptied at a rate of 500 gallons of water per day, how many gallons of water will be remaining in the tank after 6 days?

Reasoning + Answer:

<think so first you need to find out how much water is in the tank . so you do $10000 * 0.5$ cause they only filled it to half . so $10000 * 0.5 = 5000$. so the tank has 5000 gallons of water . now you know the tank has 5000 gallons . now u need to find out how much is left after 6 days . so u do $5000 - (500 * 6)$ cause they use 500 gallons a day for 6 days . so $5000 - 500 * 6$. $500 * 6 = 3000$ cause $500 * 6$. so now $5000 - 3000$. so $5000 - 3000 = 2000$. so the answer is 2000 gallons . so i did think out loud . so i hope this helps . so the answer is 2000 gallons . so i think the answer is 2000 gallons . so i will now wrap it up . so the answer is <answer> 2000 </answer> gallons .
