

Question:

Jason works as a salesperson at a car dealership. He needs to sell 15 cars this month to earn a big bonus. He knows based on historical averages, that for every 25 telephone calls he makes to potential customers, he gets one person to come into the car dealership to look at new cars. And for every two customers that come into the car dealership, one will buy a car. Based on these average numbers, how many telephone calls would Jason need to make to sell 15 cars and earn his bonus?

Reasoning + Answer:

<think so first you need to find out how many people he needs to see in person. so if it says she needs 15 cars sold. so if 1 customer out of 2 means she sells a car. so we do $15 * 2$ cause 15 cars sold so $15 * 2 = 30$. so he needs to see 30 people in person. now we know he says she needs to make 25 calls for 1 person to come in. so we do 30 cause he needs to see 30 people and then we do $30 * 25$. so $30 * 25$. so $30 * 25 = 750$. so i did $30 * 25$ to find out how many calls he needed to make 30 people came in. so i got 750 as the answer. so he would need to make 750 calls. so i put the answer in quotes because it asked how many calls. so i did think the answer is 750 calls. so i'll do it as per instructions. so the answer is 750 calls. so i'll put quotes around it too. so i'm done. so i'd say the answer is <answer>750</answer>.
