

Question:

A cat eats nine sausages in 30 minutes. A dog can eat the same number of sausages in $\frac{2}{3}$ the amount of time the cat takes. Calculate the average time the two take to eat the sausages.

Reasoning + Answer:

<think so first you need to find out how many minutes it takes the dog. so if the cat is 30 minutes and the dog does it in $\frac{2}{3}$ of that time. so you do $30 * \frac{2}{3}$. so $30 * \frac{2}{3} = 20$. so the dog takes 20 minutes. now to find the average time for both of them you do. so first you add the two times together $20 + 30$. so $20 + 30 = 50$. now you have 50. so far we have 50. the average is the total time divided by the number of times. so $50 / 2$ cause there are 2 of them. so $50 / 2$. $50 / 2 = 25$. so the answer is 25. so i did it step by step so the average time is 25 minutes. so i'll put it in the answer format. so i'll say the answer is 25 minutes. so i'm going to say. answer is 25 minutes.
