

Question:

James decided to walk to the store. When he got halfway there he realized he forgot something at home and had to walk back. If his home is 4 miles from the store and he walks 4 miles per hour how long did it take him to reach the store?

Reasoning + Answer:

<think so first you know he walked half way so if the total is 4 miles . so half of that would be 4 / 2 . so 4 / 2 = 2 . so he walked 2 mile to get to halfway . he had to do it again to get back . so we do 2 * 2 cause he did it twice . so 2 * 2 = 4 . so he walked 4 mile total . so now you do 4 / 4 because he walks 4 mph . so 4 / 4 = 1 . so the answer is 1 hour . so i did 4 / 4 and got 1 . so i think the answer is 1 . so i 'll put it in the answer box . so i answer 1 hour . so i 'll mark it as done . so i 'll put the answer here . so the answer is 1 hour . so i 'm done .
