

Question:

To fund his store, Mr. Josue solicited money from two banks. The first bank gave him \$4000, and the second company gave him twice as much. If he initially had \$5000 in capital, how much capital does he have now?

Reasoning + Answer:

<think>The amount of money Mr. Josue received from the second bank is $2 \times 4000 = 8000$ dollars
So, the total amount of money he received from both banks is $4000 + 8000 = 12000$ dollars
Since he initially had 5000 dollars in capital, now he has $5000 + 12000 = 17000$ dollars
</think><answer>17000</answer>
