

Question:

Tom plants 10 trees a year. Every year he also chops down 2 trees a year. He starts with 50 trees. After 10 years 30% of the trees die. How many trees does he have left?

Reasoning + Answer:

<think>The number of trees Tom adds to his garden each year is $10 - 2 = 8$ trees
So , after 10 years , he will have $8 \times 10 = 80$ trees
When 30% of the trees die , the number of trees that die is 30% of 80 , which is $0.30 \times 80 = 24$ trees
So , the number of trees left after 30% die is $80 - 24 = 56$ trees
</think><answer>56</answer>
