

Question:

Tomorrow, 42 adults and 15 babies will be attending a function at Mia’s restaurant. The restaurant has 5 times as many regular chairs as high chairs. If there are 8 high chairs, how many more chairs does she have to get?

Reasoning + Answer:

<think>The restaurant has 8 high chairs. Given that the restaurant has 5 times as many regular chairs as high chairs, the number of regular chairs is : $[5 \times 8 = 40 \text{ regular chairs}]$ Thus, the total number of chairs the restaurant currently has is : $[8 + 40 = 48 \text{ chairs}]$ Tomorrow, 42 adults and 15 babies will be attending the function, so the number of additional chairs needed is : $[42 + 15 = 57 \text{ chairs}]$ Therefore, the number of additional chairs Mia has to get is : $[57 - 48 = 7 \text{ chairs}]$ </think><answer>7</answer>
