

Question:

The Hortex company produces bottled carrot juices. Every day it can produce 4200 bottles of these juices. Each juice can cover 20% of 1 person's daily energy demand. How many more bottles of juices would Hortex have to produce to be able to satisfy 100% of the daily energy needs of 2300 people?

Reasoning + Answer:

<think>the energy demand of one person is $20 / 100 * 1 = 0.2$ the energy demand of 2300 people is $0.2 * 2300 = 460$ the bottles needed for 460 people is $460 * 4200 = 193200$ the bottles needed for 100% of 2300 people is 193200 the bottles produced in one day are 4200 the more bottles needed is $193200 - 4200 = 189000$
</think><answer>189000</answer>
