

Question:

The ice cream parlor was offering a deal, buy 2 scoops of ice cream, get 1 scoop free. Each scoop cost \$1.50. If Erin had \$6.00, how many scoops of ice cream should she buy?

Reasoning + Answer:

<think>Erin has \$6, each scoop costs \$1.50, so $\$6 / \$1.50 = 4$ scoops she could buy. With the deal, buy 2 get 1 free, for every 3 scoops she only pays for 2, so $4 / 2 = 2$ sets of 3 scoops she can get. Therefore she should buy $2 * 3 = 6$ scoops. <answer>6</answer>
