

Question:

James has to buy insurance. Since he had an accident it was 60% more than normal. The normal cost is \$120 a month. How much does he pay a year?

Reasoning + Answer:

<think>Normal cost is \$120/mo, so 60% more is $120 \times 0.6 = \$72/\text{mo}$. So the new cost is $120 + 72 = \$192/\text{mo}$. Then yearly cost is $192 \times 12 = \$2304$. <answer>2304</answer>
