

Question:

A 65-year-old African-American man presents to your office with dysphagia. He reports that he has found it progressively more difficult to swallow food over the past year. At the time of presentation, he is able to eat only soup. Social history is significant for asbestos exposure, multiple daily drinks of hard alcohol, and a 70 pack-year smoking history. What would you most expect to see on an esophageal biopsy of this patient? Answer Choices: A. Keratin nests and pearls B. Ferruginous bodies C. Mucosal abrasions D. Esophageal varices

Reasoning + Answer:

B . Ferruginous bodies
