

Question:

The VALIANT trial compared the effect of captopril and valsartan on mortality in patients with myocardial infarction complicated by heart failure. Subjects were randomly assigned to treatment with either captopril or valsartan and subsequently followed for 2 years. The primary endpoint was death from any cause. The study concluded that valsartan was as effective as captopril in patients who are at high risk for cardiac events after an MI. Which of the following describes this type of study? Answer Choices: A. Randomized controlled trial B. Cohort study C. Case-control study D. Crossover study

Reasoning + Answer:

<think> Given that the trial involves subjects randomly assigned to either of two treatments over an extended period and evaluates their mortality, indicating a controlled intervention over time, this delineates characteristics of a randomized controlled trial. </think> <answer> Randomized controlled trial </answer>
