

Question:

A 49-year-old obese woman presents with a chronic non-healing ulcer on the right medial malleolus. Past medical history is significant for type 2 diabetes mellitus, diagnosed 10 years ago, poorly managed with metformin. Review of systems is significant for a recurrent white vaginal discharge. The patient is afebrile, and her vital signs are within normal limits. Her BMI is 31 kg/m2. On physical examination, there is a 2 cm by 2 cm nontender, erythematous shallow ulcer present over the right medial malleolus. Sensation is decreased symmetrically in the lower extremities below the level of the midcalf. Which of the following histopathological findings would most likely be seen in the peripheral nerves in this patient? Answer Choices: A. Reduced axonal fiber diameter and fiber density B. Acute perivascular inflammation C. Lymphocytic infiltration of the endoneurium D. Accumulation of beta-pleated sheets of amyloid protein

Reasoning + Answer:

<think>considering diabetes and age of the patient</think><answer>reduced axonal fiber diameter and fiber density</answer>
