

Question:

A 63-year-old woman comes to the physician for evaluation of worsening fatigue and an unintentional 6.8-kg (15-lb) weight loss over the past 2 months. She also reports having had an unusual appetite for soil and clay for several months. She has a history of osteoarthritis of the knees, for which she takes acetaminophen. Her pulse is 116/minute and blood pressure is 125/84 mm Hg. Physical examination shows diffuse teeth abrasions and dirt in the sublingual folds. Further evaluation of this patient is most likely to show which of the following findings? Answer Choices: A. Positive stool guaiac test B. Elevated serum thyroid-stimulating hormone concentration C. Elevated serum lead concentration D. Decreased CD4+ T-lymphocyte count

Reasoning + Answer:

A. Elevated serum lead concentration
